Spreading Blocker System against Red Palm Weevil & *Paysandisia archon*

The Spreading Blocker System is a real high efficient solution for managing the high destructive pests like *Rhynchophorus ferrugineus*, *Paysandisia archon*.

This system is the first solution which interrupt the lifecycle of these insects.

It's a bidirectional biomechanical control application there it can be used for infested palms and for healthy palms.

In case of an infested palm, the insect can't leave the host and die within the net.

A healthy palm is protected against the insects.

The special nets could also be used as mobile quarantine system.

The SBS is available in different dimensions, so that it could be used for public garden, hotels, private garden, nurseries and import/export applications.

For very huge palms we suggest our Flex-System.

Reg.-No.: 202007009981.9

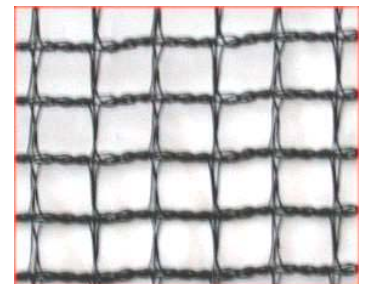

Laar SBS
